

ComAnt TP Installation Instruction

The mechanical beam tilting plate is mounted between the original antenna mount and pole with 4 pcs of M8 bolts and self locking nuts. The original 2 pcs of V-bolts supplied with the antenna are used to mount the beam tilting plate to the pole.

It allows, depending on the mounting orientation, a mechanical down or up tilting up to 45 °. The tilting angle is continuously adjustable.

It can be also used to adjust the antenna orientation on horizontal plane when the antenna is mounted on a horizontal pole.
